

AIML

MODULE PROJECT

- AIML module projects are designed to have a detailed hands on to integrate theoretical knowledge with actual practical implementations.
- AIML module projects are designed to enable you as a learner to work on realtime industry scenarios, problems and datasets.
- AIML module projects are designed to enable you simulating the designed solution using AIML techniques onto python technology platform.
- AIML module projects are designed to be scored using a predefined rubric based system.
- AIML module projects are designed to enhance your learning above and beyond. Hence, it might require you to experiment, research, self learn and implement.

AIM

MODULE PROJECT

COMPUTER VISION

AIML module project part I consists of task to train and compare image classifier models using supervised learning classifier, neural network classifier and a CNN classifier.

AIML module project part II consists of curating images and its respective annotations from scratch.

TOTAL 30 SCORE

PART **ONE**

PROJECT BASED

TOTAL **SCORE** 20

- · DOMAIN: Entertainment
- **CONTEXT:** Company X owns a movie application and repository which caters movie streaming to millions of users who on subscription basis. Company wants to automate the process of cast and crew information in each scene from a movie such that when a user pauses on the movie and clicks on cast information button, the app will show details of the actor in the scene. Company has an in-house computer vision and multimedia experts who need to detect faces from screen shots from the movie scene.
- DATA DESCRIPTION: The dataset comprises of images and its mask where there is a human face.
- PROJECT OBJECTIVE: Face detection from training images.

Steps and tasks: [Total Score: 20 points]

- 1. Import the dataset.
- 2. Create features (images) and labels (mask) using that data.
- 3. Mask detection model:
 - Design a face mask detection model.

Hint: Use U-net along with pre-trained transfer learning models

- Design your own Dice Coefficient and Loss function.
- Train, tune and test the model.
- Evaluate the model using testing data.
- 4. Use the "Prediction image" as an input to your designed model and display the output of the image.

PART **TWO**

TASK **BASED**

TOTAL **SCORE** 10

- DOMAIN: Entertainment
- **CONTEXT:** Company X owns a movie application and repository which caters movie streaming to millions of users who on subscription basis. Company wants to automate the process of cast and crew information in each scene from a movie such that when a user pauses on the movie and clicks on cast information button, the app will show details of the actor in the scene. Company has an in-house computer vision and multimedia experts who need to detect faces from screen shots from the movie scene.
- TASK: Help to create an image dataset to be used by the AI team to build an image classifier data. Profile images of people are given.
 - 1. You are expected to curate the bounding box co-ordinates for each image. These are also called annotations.
 - 2. This task can be done using manual methods where you need to open each image and note the coordinates where the face located [though it is not recommended]. This task can be easily done using an automation where you need to input the image in the automation and the output is the coordinates of the face detected from the image. [this is highly recommended]. Also highlight how many faces detected in each image.

Refer to the sample image below:

Actual values form python:

	X	У	w	h	Total_Faces	Image_Name
0	94	144	390	390	1	real_00251.jpg
1	65	87	459	459	1	real_00537.jpg

3. Comment on the challenges faced during this task.

Please note: This will require your analytical, research and development skills to try and design the automation required.

LEARNING OUTCOME

"Put yourself in the shoes of an actual"

DATA SCIENTIST

THAT's YOU

Assume that you are working at the company which has received the above problem statement from internal/external client. Finding the best solution for the problem statement will enhance the business/operations for your organisation/project. You are responsible for the complete delivery. Put your best analytical thinking hat to squeeze the raw data into relevant insights and later into an AIML working model.

PLEASE NOTE

Designing a data driven decision product typically traces the following process:

1 Data and insights

Warehouse the relevant data. Clean and validate the data as per the the functional requirements of the problem statement. Capture and validate all possible insights from the data as per the functional requirements of the problem statement. Please remember there will be numerous ways to achieve this. Sticking to relevance is of utmost importance. Pre-process the data which can be used for relevant AIML model.

2. AIML training:

Use the data to train and test a relevant AIML model. Tune the model to achieve the best possible learnings out of the data. This is an iterative process where your knowledge on the above data can help to debug and improvise. Different AIML models react differently and perform depending on quality of the data. Baseline your best performing model and store the learnings for future usage.

3. AIML end product:

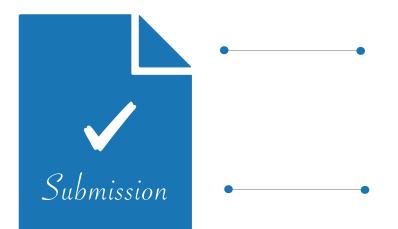

Design a trigger or user interface for the business to use the designed AIML model for future usage. Maintain, support and keep the model/product updated by continuous improvement/training. These are generally triggered by time, business or change in data.

IMPORTANT POINTERS

Project should be submitted as a single ".html" and ".ipynb" file. Follow the below best practices where your submission should be:

- ".html" and ".ipynb" files should be an exact match.
- Pre-run codes with all outputs intact.
- Error free & machine independent i.e. run on any machine without adding any extra code.
- Well commented for clarity on code designed, assumptions made, approach taken, insights found and results obtained.

Project should be submitted on or before the deadline given by the program office.

Project submission should be an original work from you as a learner. If any percentage of plagiarism found in the submission, the project will not be evaluated and no score will be given.
